

PHISH Finder

Designed to stop “trusted” phishing attacks in their tracks, Phish Finder prevents users from giving away their credentials by validating sanctioned URLs.

With over 250,000 credentials stolen every week and millions of new phishing websites infiltrating the Internet every year, organizations are being forced to reconsider their current threat protection strategies. It is no longer sufficient to say that “We have a firewall, anti-virus, and disk encryption technology so we are secure.” Cyber-attacks will happen; therefore, organizations must be able to prevent, detect and respond to breaches quickly. Regardless of your organization’s size or industry, every company is a target.

How It Works

Part of Forsyte’s four-step approach to phishing defense, Phish Finder is designed as a browser independent add-in and utilizes an enterprise grade REST-compliant web service to maximize interoperability.

Phish Finder provides the ability to define a Whitelist of trusted sites for your domain users. When a phishing attack occurs redirecting users to what appears to be a “trusted” site, Phish Finder detects the anomaly and takes action. The user automatically receives an alert identifying the unknown site and prevents the user from entering their password.

Because hackers are continuously launching new sites, Phish Finder will automatically aggregate all harmful sites into a Blacklist. As a further benefit, the harmful sites you encounter are combined with sites identified by other Phish Finder users to create a comprehensive, global Blacklist. The data is consumed by Phish Finder and can be consumed by other threat protection tools you already utilize.

SOLUTION BENEFITS:

Benefit 1

Monitors when a user tries to enter credentials from your protected domain and then determines if the site is authorized.

Benefit 2

Provides a visual alert to a user that a site is potentially unsafe and prevents users from entering their credentials.

Benefit 3

Allows you to define an enterprise Whitelist of trusted sites where the organization’s credentials can be safely used.

Benefit 4

Automatically maintains an aggregated list of all harmful sites into a Blacklist, which can be used across the enterprise to prevent users from falling prey to attacks.

Forsyte IT Solutions is Microsoft’s leading provider of Email Security, Identity Management and Data Protection. Forsyte’s team of senior level MCSEs and MCSDs have tackled hundreds of complex and challenging IT projects. At our core, Forsyte’s mission is to protect our client’s most important assets: their people and their data. As a Microsoft Gold Certified Partner, Forsyte provides expert, high quality, user and data protection solutions to medium and large organizations across multiple industries, including education, state and local government, and the commercial sector.
